

M54585KP

8-UNIT 500mA DARLINGTON TRANSISTOR-ARRAY WITH CLAMP DIODE

DESCRIPTION

M54585KP is eight-circuit Darlington transistor arrays with clamping diodes. The circuits are made of NPN transistors. Both the semiconductor integrated circuits perform high-current driving with extremely low input-current supply.

FEATURES

- High breakdown voltage ($BV_{CEO} \geq 50V$)
- High-current driving ($I_{C(max)} = 500mA$)
- With clamping diodes
- Driving available with TTL output or with PMOS IC output
- With shrink small outline package

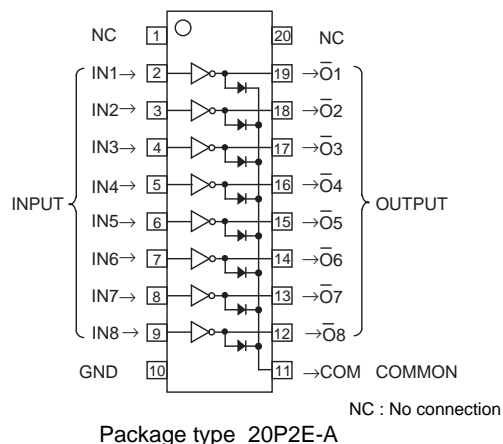

APPLICATION

Drives of relays and printers, digit drives of indication elements such as LEDs and lamps, and MOS-bipolar logic IC interfaces

FUNCTION

The M54585KP has eight circuits, which are NPN Darlington transistors. Input transistors have resistance of $2.7k\Omega$ between the base and input pin. A spike-killer clamping diode is provided between each output pin and GND. Output transistor emitters are all connected to the GND pin. Collector current is 500mA maximum. The maximum collector-emitter voltage is 50V.

PIN CONFIGURATION

The eight circuits share the COM and GND.

The diode, indicated with the dotted line, is parasitic, and cannot be used.
